## Smooth Sided Toad *(Bufo/Rhaebo guttatus)*

---

### **Giant Streaks of Red and Orange!**

The smooth sided toad is a large, bulky terrestrial toad species occurring from over much of northern, central, and eastern South America. This species occurs in the Amazonian basin region of Ecuador, Colombia, Brazil, Bolivia, Venezuela, French Guiana, Guyana and Suriname. These toads range in color from brown, reddish brown, to bronze with a darker broad reddish colored lateral stripe on each side of the body. The skin is dry and warty, and paratoid glands large and evident on this toad species.

When threatened, these toads can secrete a noxious and distasteful, milky substance from their large, kidney shaped paratoid glands behind their eyes which discourages potential predators from eating them. These large, terrestrial toads occupy the forest floor, and will burrow into the leaf litter and soil to seek refuge. Smooth sided toads and some related species are a controlled, regulated, or prohibited species in some states. Always check any applicable federal, state, and local laws and ordinances that may pertain to the specific possession of this species.

### **Taxonomy**

**Life:** All living, physical, and animate entities

**Domain:** Eukaryota

**Kingdom:** Animalia

**Phylum/Sub Phylum:** Chordata/Vertebrata

**Class:** Amphibia

**Order:** Anura

**Suborder:** Neobatrachia

**Family:** Bufonidae

**Genus:** Rhaebo or Bufo

**Species:** *Rhaebo/Bufo guttatus*\*

*\*Taxonomy subject to change and revision.*

### **Lifespan and Longevity**

If provided the proper care, smooth sided toads can attain longevity of 10 to 15 years or more in captivity.

### **Distribution and Habitat**

The smooth sided toad is a large, terrestrial toad species which has a broad distribution over much of northern, central, and eastern South America. This species occurs in the Amazonian basin region of Ecuador, Colombia, Brazil, Bolivia, Venezuela, French Guiana, Guyana and Suriname. Within this range, these toads are found primarily in tropical, moist rainforests and other forests, where they occupy the forest floor leaf litter, riverbanks, and margins of wetlands and other bodies of water.

### **Origin/History**

*Rhaebo guttatus* (Schneider, 1799).

Smooth Sided Toads are typically imported from their native ranges and thus a majority of the animals available in the hobby are wild caught adults. It is uncertain as to when they first entered the pet trade, although the smooth sided toad has been available for at least several decades. Fortunately, healthy captive bred animals would also become available. These toads would make for popular pets due to their impressive sizes.

### **Experience Level Required**

Intermediate/Moderate.

### **Size**

Adult smooth sided toads can reach 5 ½ to 6 inches in males, and larger females reaching up to 9 inches, or sometimes larger and weighting as much as nearly 6 lbs.

### **Housing and Enclosure**

***Enclosure System: Primarily Moist-Terrestrial to Semi-Fossorial.*** Housing must be sealed and escape proof with a secured top or aquarium hood. A single adult smooth sided toad can be housed in a 20 to 40 gallon terrarium, enclosure, or appropriately sized plastic container with a securely fitted lid or top. Smooth sided toads can be cannibalistic, and should therefore not be housed together, particularly with smaller toads. These toads require higher levels of humidity, and substrates that can help establish and maintain the necessary humidity levels that can be used include coconut husk fibers, cypress mulch, live/sphagnum moss, and pesticide/fertilizer free potting soil. Paper towels can also be used for a less attractive, yet utilitarian substrate for these toads. Smooth sided toads will also benefit from daily misting as well. Other furnishings to provide can include live or artificial plants for added aesthetics, and hides such as upturned plastic or ceramic plant pots, log or rock hides, or similar hides. Also provide a large, shallow water dish in the enclosure and change at least 2 to 3 times weekly. Spot clean daily and clean the enclosure at minimum every 2 to 4 weeks.

### **Temperature, Lighting, and Humidity**

Smooth sided toads have simple and undemanding heating and lighting requirements in captivity, and do not require additional UVA/UVB lighting, although providing it in moderated amounts can be greatly beneficial for their health, immune system, and overall wellness. For any supplemental heating that may be needed, use a low wattage incandescent or UVA/UVB bulb, radiant or ceramic heat emitter, or UTH (under tank heating element). Maintain these toads at higher humidity at around 70 to 80%, and be sure to mist the enclosure at least once daily. These toads can be maintained at or around 70 to 85 degrees F. Provide a 12 to 14 hour light cycle if overhead lights are used. More specific lighting, heating, and humidity product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

### **Feeding, Diet, and Nutrition**

***Insectivorous to Carnivorous***; Smooth sided toads can be voracious predators in the wild, and will feed on a variety of insects, arachnids, worms, and other invertebrates. They may also occasionally catch and consume smaller vertebrates as well, and will often even scavenge leftover dog or cat food if left outdoors. These large toads in captivity should be fed 2 to 3 times weekly. They are very sight oriented feeders, and will eat feeder crickets, roaches, earthworms, redworms, bloodworms, or mealworms as well as feeder fish and occasionally pre-killed rodents of appropriate size, although these prey items should be given only sparingly. They can also be given many commercially available pelleted diets, or freeze dried foods, but these must be animated. Do not overfeed smooth sided toads, or obesity and other health issues can become concerns. Feeder insects should be gut loaded by provided them a quality diet containing vitamins and minerals. Gutloading and dusting insects with vitamin D3 and calcium supplements 1 to 2 times weekly for added nutritional value will greatly benefit the health and well-being of these toads. Feed them using tongs, forceps, or otherwise in the enclosure or in a dish and not by hand, as they can become acclimated enough to mistake a moving hand or finger as food during feeding. More specific dietary and supplementary product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

### **Handling**

Smooth sided toads are large, hardy amphibians when it comes to handling. Many of the more terrestrial species of toads in the genera Bufo and Rhaebo are more tolerant of drier or varied conditions associated with common handling practices, but over handling even these species should be avoided, and care should still be taken to prevent them from drying out or becoming susceptible to any chemicals or lotions worn on the skin. The smooth sided toad, and some other related species do possess medically significant bufotoxins that can be excreted as a white, milky substance from their large paratoid glands when the toad is physically attacked or otherwise threatened sufficiently. While largely common sense and no known human deaths have been attributed to these toads, never allow ingestion or facial contact with these toads, or allow contact with very young children, or other pets or animals. A smooth sided toad's bufotoxins can be fatal for many species that try to ingest these toads. Smooth sided toads and related species are also listed as a controlled or prohibited species in some states and localities; know any and all applicable laws, legislation, and ordinances that may pertain to possession of these species.

**\*\*Also be sure to practice basic cleanliness and hygiene associated with proper husbandry after touching or handling any animals or animal enclosures to prevent the possibility of contracting salmonellosis or any other zoonotic pathogens\*\***
