Spotted Pond Turtle (*Geoclemmys hamiltonii*)

Dashing and Dotted!

Also known as the Black Pond Turtle, or Indian Spotted Turtle, the Spotted Pond Turtle is a monotypic, or singly occurring within its genus species of medium sized to large, semi aquatic turtle indigenous to the freshwater environments of southern to southeastern Asia. These turtles are active baskers, and readily use partially submerged rocks, logs, riverbanks, or other debris as basking their preferred basking sites. Their carapaces range from black to dark brownish with variable amounts of whitish to yellowish radiating spots, streaks, or dashes, including on their heads and necks. Their carapaces are also slightly elongated and heightened as well, with prominent dorsal keels, and weakly to moderately serrated rear marginal scutes, depending on the age of the turtle. As with many other Asian turtle species, this species is threatened by many factors, including overharvesting or unsustainable collection for the food, pet, and medicine industries, as well as by habitat loss, fragmentation, and pollution. Because of the many threats these turtles face, they are now both Endangered Species Act and CITES listed. While importation of these dashing turtles, and their interstate transport is either prohibited, or closely regulated by federal agencies, Captive Born Wildlife Permits are available to make keeping and working with these beautiful and endangered turtle species still a possibility for the more intermediate level reptile enthusiast willing to put in a little extra legwork to be able to keep these beautiful turtles!

Taxonomy

Life: All living, physical, and animate entities

Domain: Eukaryota

Kingdom: Animalia

Phylum/Sub Phylum: Chordata/Vertebrata

Class: Reptilia

Order: Testudines

Suborder: Cryptodira

Family: Geoemydidae

Subfamily: Geoemydinae

Genus: *Geoclemmys*

Species: *Geoclemmys hamiltonii**

*Taxonomy subject to change and revision.

Lifespan and Longevity

Spotted pond turtles may attain longevity of 20 to 40 years or more with proper care and conditions.

Distribution and Habitat

Southern pond turtles are indigenous to southern to southeastern Asia, from southern Pakistan, to northeastern India, Sri Lanka, and Bangladesh. Within their ranges, spotted pond turtles prefer shallow, well vegetated wetlands and bodies of water including shallow, weedy, isolated ponds, wet meadows, fens, tamarack and coastal swamplands, isolated inlets of lakes, seepages, sphagnum bogs and marshes, and slow moving rivers and streams. These turtles may also wander or travel overland in search of new habitats as well.

Experience Level Required

Intermediate/Moderate.

Size

A fairly small to moderately sized species, spotted pond turtles typically reach 11 to 12 inches in carapace length, with males being sexually dimorphic in size and smaller, usually up to 7 to 8 inches carapace length. Up to 15 to 16 inches carapace length have been documented.

Housing and Enclosure

Enclosure System: Semi-Aquatic. Spotted pond turtles are semi aquatic turtle species. Provide a sturdy, escape proof aquarium or commercially available plastic or galvanized stock tank or turtle tub of sufficient size with an elevated dock or basking area/access to dry land using a substrate dam. The latter are perhaps preferred for maintaining aquatic to semi-aquatic turtles in, as they are easier to clean, move/transport, and maintain than aquariums. Provide a minimum of 10 gallons of space per inch of shell, or about 40 to 90 gallons for most adult spotted pond turtles. Similarly, a 6 foot by 3 foot by 3 foot, or similar sized plastic tub or trough can also work well for these turtles. A general rule of thumb to follow for spotted turtles is to provide water is only deep enough to allow for complete submersion, and at least two to three times the carapace length for adequate swimming and movement. A powerful water filter rated at least twice that of the amount of water in the enclosure is highly recommended for aquatic turtles, as they are messy and require frequent cleaning and regular water changes. Use a submersible water heater with a guard to maintain water temperatures of 75 to 85 degrees F. Also provide a 90 to 95 degree basking area, and a 75-80 degree F ambient, or air temperatures within the enclosure. Substrate is optional, and foregoing it makes for easier cleaning and maintenance, but small to medium sized gravel can be used. Additional rocks, logs, live or artificial foliage can also be provided for additional foraging, basking, and hiding opportunities.

Temperature, Lighting, and Humidity

Providing the correct amounts of UVA/UVB overhead incandescent and florescent lighting, and calcium-to-phosphorus ratios is essential for ensuring the health and overall well-being of spotted pond turtles in captivity. Without UVA/UVB, or adequate amounts of it, they can be susceptible to the abnormal bone and shell growth and development known as Metabolic Bone Disease (MBD), and other health and development maladies. Pyramiding of the scutes and shell can also occur due to poor or improper diet, lighting, or heating. Always be sure to spot clean the enclosure for urates, feces, or uneaten food at least twice per week. Be sure to periodically replace the substrate, clean, and disinfect the enclosure and its furnishings at minimum every 2 to 3 months. Spotted pond turtles require a thermal gradient using a ceramic or radiant heat emitter, UTH (or under tank heating pad), and UVA/UVB overhead lighting. Ambient and cool end temperatures should be within 75 to 80 degrees F and the basking area from 90 to 95 degrees F. Also be sure to maintain a light cycle of 12 to 14 hours per day, and monitor temperatures with a quality thermometer. Be sure to provide a basking area or platform for your spotted pond turtle

to emerge completely from the water as well. More specific lighting, heating, and humidity product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well. While humidity is somewhat less important for most aquatic to semi-aquatic turtles, a general humidity level should be at, or around about 60 to 75%.

Feeding, Diet, and Nutrition

Omnivorous to Carnivorous; In the wild, spotted pond turtles are primarily omnivorous to carnivorous, feeding on aquatic to semi-aquatic insects, crustaceans, mollusks, and other invertebrates, as well as smaller vertebrates including small fish, amphibians, and carrion, or dead and decaying plant and animal material. Some algae and other aquatic plants may also be consumed.

In captivity, variety is important with most aquatic to semi-aquatic turtle's diets. Spotted pond turtles can be given feeder insects of appropriate size including crickets, roaches, mealworms, waxworms, superworms, or other invertebrates. They can also eat small, frozen-thawed rodents of appropriate size, but offer these sparingly, if at all. Other food items that will be accepted by these turtles can include many of the commercially available aquatic to semi-aquatic turtle or omnivore mix diets, small feeder fish of appropriate nutritional value, earthworms, redworms, freeze dried shrimp or krill, or some other meats. Dog and cat foods can also be used, but use these sparingly, if at all as well. They can also be fed some chopped greens, fruits, and vegetable material as well. Commercially available canned or pelleted turtle diets are not good staples for feeding aquatic to semi-aquatic turtles, and should not exceed roughly 25% of their diets; Variety is always best.

Gutloading any feeder insects and providing additional calcium and vitamin D3 is essential for these turtle's optimal health and well-being. Without proper supplementation, they are susceptible to Metabolic Bone Disease, pyramiding of the shell, and other abnormal bone, growth, and health maladies. Feeding frequency will depend on the age, size, and overall health of your turtle, but typically in most cases should be twice to three times weekly. Do not overfeed them, though as obesity and other health related issues can become a concern. More specific dietary and supplementary product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

Handling

Spotted pond turtles are fairly shy turtles that should be handled sparingly, or in moderation in most cases. Most small to mid-sized turtle and tortoise species that are not aggressive or prone to biting can be picked up and handled either by placing both hands along both sides of the shell, or from the rear of the carapace with the thumb on the carapace and index through pinky fingers on the plastron to reduce the chances of being kicked, scratched, or nipped when they are threatened. Although most species of chelonians are not outwardly aggressive, defensive, or dangerous, they can become stressed as a result of over-handling, however, and some species, and even individual animals can be shyer than others. These are some considerations to keep in mind when handling any chelonian species.

****Also be sure to practice basic cleanliness and hygiene associated with proper husbandry after touching or handling any animals or animal enclosures to prevent the possibility of contracting salmonellosis or any other zoonotic pathogens****
